MONT BLANC NEW ROPEWAYS

construction and operation in extreme working conditions

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

Regione Autonoma
Valle d'Aosta

THE CURRENT ROPEWAYS

Mont Blanc ropeways were made between 1940 and 1947 from military state property.

The current ropeways consist of three sections that lead from La Palud - Courmayeur (1370 m) to Punta Helbronner (3452 m), in the core of the Mont Blanc mountain chain.

In the year 2000 the property of the ropeways passed from the domain to the Autonomous Region of Valle d'Aosta, because the installations were due to expire of technical life (year 2007).

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

THE ROPEWAYS TODAY

Regione Autonoma
Valle d'Aosta

First section "La Palud – Pavillon"

- Tensioning bottom station 1370 m a.s.l.
- Driving upper station: 2178 m a.s.l.
- Inclined length: 1806 m
- Difference in level: 808 m
- Capacity: 260 p/h
- Capacity of each car 26+1 persons
- Maximum speed 8 m/s
- Trip duration: 5 minutes

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

THE ROPEWAYS TODAY

Regione Autonoma
Valle d'Aosta

Second section “Pavillon – Rifugio Torino”

- Tensioning bottom station: 2181 m a.s.l.
- Driving upper station: 3329 m a.s.l.
- Inclined length: 2440 m
- Difference in level: 1148 m
- Capacity: 300 p/h
- Capacity of each car 30+1 persons
- Maximum speed 10 m/s
- Trip duration: 5 min. 56 Sec

BRIGIDE OVER TWO NATIONS

Regione Autonoma
Valle d'Aosta

Mont Blanc ropeways are an integral part of international transport connection between Courmayeur (Italy) and Chamonix (France), and form a strong relationship between the two alpine communities located at the foot of the Mont Blanc. During the years of the tunnel traffic closure they represented the only cross-border direct connection between the two valleys.

The glacier crossing from Courmayeur (1370 m) to Chamonix (1030 m), through Punta Helbronner (3452 m) and Aiguille du Midi (3842 m), by the cable car is still one of the most audacious transport infrastructure in the world.

The brilliance and uniqueness of solutions are still astonishing (eg suspended tower), and it's remarkable the genius of the inventor ing. Lora Totino and the work of all the people who have worked for their realization more than 60 years ago. It is a transport infrastructure which is both a link between the alpine communities, and cultural heritage and technology to be exploited

THE GREAT PRECURSOR

Regione Autonoma
Valle d'Aosta

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

THE NEW ROPEWAYS

Regione Autonoma
Valle d'Aosta

The new ropeways project is divided in two sections from 1308 m of altitude of Pontal d'Entreves to 3452 m of Punta Helbronner.

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

OBJECTIVES

Regione Autonoma
Valle d'Aosta

1. **Increase transport capacity**: replace the current expiring ropeways improving the hourly flow and ensuring the international connection with the plants in France
2. **Improve safety and reliability**: ensure access and evacuation of tourists, especially from sites at high altitude, in all weather conditions
3. **Valorize the features of the site**: build installations and stations so that customers can enjoy the incomparable view of the Mont Blanc
4. **Provide facilities and comfort**: equip the stations of appropriate areas of public utility released by commercial facilities and dining options, museum areas, paths of study, multimedia and scenic areas outdoor and indoor to allow a pleasant stay also in the days of bad weather
5. **Respect for the environment**: build stations integrated and harmonized with surrounding areas by reducing environmental impact and energy requirements; install highly technological plant for water supply and waste management; recovery of the areas of the site and the old volumes disused

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

CHARACTERISTICS

Regione Autonoma
Valle d'Aosta

1st section Pontal d'Entrèves – Mont Fréty

Hourly flow	800	pers/h
Inclined length	1.748	m
Height difference	864	m
Line speed with main drive	9,0	m/s
Carrier mass with full load	15.000	kg
Carriers capacity	80	pers
Main drive power	650	kW
Reserve drive power	325	kW
Recovery drive power	120	kW
Rescue drive power	120	kW
Towers	3	
Carrying ropes diameter	64	mm
Upper hauling rope diameter	35	mm
Lower hauling rope diameter	35	mm
Rescue rope diameter	16	mm

ROPEWAY CHARACTERISTICS

Regione Autonoma
Valle d'Aosta

Rotating Cabins

A ropeway ball-like (the spherical shape has always been the preferred design for the spaceships) for Mont Blanc, offers many advantages. The sphere is the shape that has the outer surface lower with respect to the volume. It has no corners or edges, so it is able to support the load evenly from all sides. It does not show structural defects and it is the form less wasteful of energy.

The cars become a center of information and entertainment during the trip. Passengers receive on the screens detailed information on current weather, avalanche risk, offers, schedules of the plant, events, promotions and various news. A camera placed under the floor allows to transmit in the cab panoramic images of the valley below.

The rotating cab does a complete turn during the single trip allowing everyone to see the panorama to 360°

Regione Autonoma
Valle d'Aosta

Punta Helbronner

TUNNEL

Length:	167 m
Difference in level	3.16 m
Height	3m
Useful width :	2.5m

SHAFT

Difference in level	76.94 m
Inner Diameter:	5m
Bored Diameter:	6-7 m
Concrete Covering:	0,5 - 1m
Piloting hole:	200 mm
Raise Bore:	1,5 m

Rifugio Torino nuovo

Tunnel

Shaft

The shaft, made by reinforced concrete with internal diameter of 5 m and about 80 meters deep in the rock, ensures the consolidation of the rocky substrate and provides maximum safety to the anchorages of the ropes. The structure equipped with central elevators and emergency staircase, offers the connection between the refuge "Torino Nuovo" and the new station, because the new project, will eliminate the current stop near the Refuge.

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

PUNTA HELBRONNER

Regione Autonoma
Valle d'Aosta

The edgy nature of the external forms is in close relationship with the use of materials with high performance. The selected shapes are also able to avoid accumulation of snow and ice on the outside surfaces of the building, even through the contribution of thermostatic performance of the coating materials.

INNSBRUCK 2013

NUOVE FUNIVIE DEL MONTE BIANCO

PUNTA HELBRONNER

Regione Autonoma
Valle d'Aosta

The stingy space availability has pushed the shapes toward the empty slopes in search of spaces projecting. The elements of different materials (reinforced concrete, steel, wood and glass), provides an original interior environmental content in close relationship with the outside

SITE ORGANIZATION

Regione Autonoma
Valle d'Aosta

Today 120 people are working over the 7 different sites.

The supply of the materials is organized through the use of four ropeway conveyors and seven cranes:

Ropeway conveyors:

- T1 – Brenva – Pavillon (10 ton)
- T2 – Line 1 (5 ton)
- T3 – Pavillon – Rifugio Torino (5 ton)
- T4 – Line 2 (5 ton)

Cranes:

- 2 at the site of Pontal
- 1 at the site of Pavillon
- 3 at the site of Punta Helbronner (2 of them are used to carry material from the T3 top station to Punta Helbronner)
- 1 along the line to carry out the assembly of towers
